AB The present invention relates to a catalyst composition and a method for making the catalyst composition of a polymerization catalyst and a carbonyl compound. The invention is also directed to the use of the catalyst composition in the polymerization of olefin(s). In particular, the polymerization catalyst system is supported on a carrier. More particularly, the polymerization catalyst comprises a bulky ligand metallocene-type catalyst system.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A process for **transitioning** between two **catalysts** is disclosed, comprising the steps of a) discontinuing the feed of the first catalyst into the polymerization reactor, and then b) introducing the second catalyst into the reactor, wherein one of the catalysts comprises a late transition metal catalyst and the other is a catalyst which is incompatible therewith. It is preferred that the late transition metal catalyst is a 2,6-diacetyl pyridine iron catalyst.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The invention provides a process for reducing the low molecular weight oligomer content of olefin polymers produced by metallocene catalysis wherein at least one organometallic compound is fed continuously into the reactor during polymerization. The organometallic compound has the formula R.sup.1.sub.nA, wherein A is a Periodic Table Group 12 or 13 element. R.sup.1 is the same or different, substituted or unsubstituted, straight or branched chain alkylradical, cyclic hydrocarbyl radical, alkyl-cyclohydrocarbyl radical, aromatic radical or alkoxide radical and n is 2 or 3, to form a polymer product having a content of said compound of at least about 50 weight ppm.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB In gas phase **fluid bed polymerization** processes, operation can be achieved over wider ranges of fluidizing gas

velocities without incurring undue energy costs by adjusting the pressure drop through the grid below the bed to provide a ratio of pressure drop through the grid to pressure drop through the grid and bed above about 0.15:1. The range of fluidizing gas velocities can enhance the practicality of operating the processes over varying bed heights while reducing the risk of forming deposits of polymer. The processes of the invention are particularly useful to accommodate start-ups, catalyst transitions and shutdowns.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The invention provides a process for reducing the low molecular weight oligomer content of olefin polymers produced by metallocene catalysis wherein at least one organometallic compound is fed continuously into the reactor during polymerization. The organometallic compound has the formula R.¹.sub.nA, wherein A is a Periodic Table Group 12 or 13 element. R.¹ is the same or different, substituted or unsubstituted, straight or branched chain alkylradical, cyclic hydrocarbyl radical, alkyl-cyclohydrocarbyl radical, aromatic radical or alkoxide radical and n is 2 or 3, to form a polymer product having a content of said compound of at least about 50 weight ppm.

L3 ANSWER 2 OF 25 USPATFULL on STN

AB A process for **transitioning** between two **catalysts** is disclosed, comprising the steps of a) discontinuing the feed of the first catalyst into the polymerization reactor, and then b) introducing the second catalyst into the reactor, wherein one of the catalysts comprises a late transition metal catalyst and the other is a catalyst which is incompatible therewith. It is preferred that the late transition metal catalyst is a 2,6-diacetyl pyridine iron catalyst.

SUMM [0001] The present invention relates to a process for the polymerisation and copolymerisation of 1-olefins, and particularly to a process for **transitioning** between different **polymerization catalyst** systems.

SUMM [0005] EP-A-75 1965 discloses methods of **transitioning** between incompatible **catalysts**, involving the use of catalyst killers. It defines "incompatible" catalysts as those which satisfy one or more of the following criteria: 1) those catalysts that in each other's presence reduce the activity of at least one of the catalysts by greater than 50%; 2) those catalysts such that under the same reactive conditions one of the catalysts produces polymers having a molecular weight greater than two times higher than any other catalyst in the system; and 3) those catalysts that differ in comonomer incorporation or reactivity ratio under the same conditions by more than about 30%.

SUMM [0035] After introduction of the first catalyst has been discontinued, the polymerisation reactor may be partially or completely emptied. Completely emptying the reactor ensures that when the second catalyst is introduced, all the polymer subsequently produced is purely that derived from the second catalyst. However it is preferred at most only to partially empty the reactor, e.g. by reducing the bed height in the case of a gas phase **fluidised bed reactor**, as this is less disruptive of the polymerisation process. Although this results in the polymerisation with the second catalyst initially producing polymer which is mixed with polymer derived from the first catalyst, this is a relatively minor problem in the case of the present invention, because one of the catalysts is a late transition metal catalyst. Typically, between zero and half of the contents of the reactor by volume may be removed, though preferably only one third or less are removed. In the most preferred case, none of the contents of the reactor are removed prior to commencing the polymerisation with the second catalyst.

DETD [0093] Into a **fluidized bed reactor** heated at 30° C. and supplied with a fluidisation gas composed of nitrogen containing less than 2 vpm of water vapour and with a flow rate of 4.7 ml/s, were charged 15 kg of a granular chromium catalyst sold under the trade name EP30XA by Ineos Silicas (Warrington, England). The characteristics of this catalyst are: surface area=320 m.sup.2/g, pore volume=1.7 ml/g and chromium content=0.25% by weight. Next the reactor was heated from 60° C. to 150° C. at a rate of 100° C./h. The catalyst was then maintained at 150° C. for 30 minutes in the fluidised state. Next 12.5 moles of a mixture of isopropyl titanate and n-butyl titanate sold under the trade name "Tilcom BIP" by Titanium Intermediates Limited (Billingham, England) were introduced

into the reactor. The reactor was then maintained at 150° C. for 2 hours. The reactor was then heated from 150° C. to 300° C. at a rate of 100° C./h.

DETD [0095] A **fluidised bed reactor** 74 cm in diameter was used for the polymerisations. This contained a fluidized bed and was operated at 90° C. using Catalyst 3. The gas phase was composed of hydrogen, nitrogen, ethylene and hexane fluidised at 42 cm/sec. The partial pressures of the components of the gas mixture are given in Condition 1 of Table 2 below.

AB The present invention relates to a catalyst composition and a method for making the catalyst composition of a polymerization catalyst and a carboxylate metal salt. The invention is also directed to the use of the catalyst composition in the polymerization of olefin(s). In particular, the polymerization catalyst system is supported on a carrier. More particularly, the polymerization catalyst comprises a bulky ligand metallocene-type catalyst system.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

PRIORITY APPLN. INFO.:			US 2000-694868	20001024

AB The invention relates to a process for **transitioning** from **polymerizing** sticky **polymer** to polymerize another sticky polymer in gas phase fluidization bed production to decrease transition time, reduce off-grade material, and/or prevent operational difficulty. The process comprises steps of: (a) terminating the feed of catalyst to a reactor, thereby allowing reaction rate to decrease; (b) terminating the polymerization using a reversible catalyst kill agent; (c) passivating the polymer with a gel inhibitor; (d) stopping polymer transfer from the reactor to the post-reaction purging and polishing equipment, thereby recovering aim-grade product from the post reaction equipment; (e) flow and pressure purging to remove kill agent; (f) feeding cocatalyst and optional promoters to establish concns. of these components; (g) establishing reaction conditions for the second sticky polymer; (h) re-initiating catalyst feed; and (i) re-initiating fluidization aid, cocatalyst, optional promoter and diene feeds.
